(54) Title: A METHOD AND SYSTEM FOR SUPPORTING THE QUALITY OF SERVICE IN WIRELESS NETWORKS

(57) Abstract

A mechanism is provided for supporting differentiated services (quality of service) in a radio network. A radio access system is provided which supports the quality of service in data packet transmission over its air interface. The system comprises a selection of predefined default radio flows having different quality of service characteristics and means (4, 52) for selecting a radio flow having appropriate quality of service characteristics for the packet to be transmitted over the air interface from the selection.
